7	26 <sup>th</sup> December	High Atlas. Cascades du Imouzzer.
8	27 <sup>th</sup> December	Return to the UK.

Above - Dromedaries at Oued Tamri. Front - the Anti-Atlas.

#### Day One: 20th December. Departure from the UK, transfer to Atlas Kasbah.

With our early departure from London Gatwick we were looking forward to reaching Morocco in time for lunch. Upon arriving at the airport however, it became apparent that all was not right, with no flights landing or departing since the previous evening; the airport was in lockdown, as a result of drones spotted flying over the runway.

After some hours waiting for news, we were finally on our way, taken to London Luton to board an outbound 'rescue flight'. Whilst it wasn't the start to our holiday we had planned, we were very fortunate to be headed to our destination, during a day which had seen hundreds of flights cancelled and over 100,000 people affected. And so it was that we were welcomed to the Atlas Kasbah in the early hours of the next morning; exploration of our home for the week could wait until the morning!

#### Day Two: 21st December. Atlas Kasbah. Tighanimine El Baz (Valley of the Eagle).

We had a relaxed start to the day, with bleary eyes brightening as we took in the surroundings of our hotel, nestled in the foothills of the High Atlas, east of Agadir. The Atlas Kasbah was built with the objective of promoting responsible travel, both in terms of sustainable use of resources and environmental protection, but also in showcasing Berber culture, and supporting the local communities.

Following our first breakfast, discovering the tasty delights under the many tajines that graced the table, we were taken on a tour of the hotel by Rachida, under a sunny and blue Moroccan sky. There was then time to enjoy a stroll through the gardens of the hotel, and our first sightings of the Common Bulbuls, whose sight and simple, cheerful song would become very familiar over the next week.

We looked first at an Argan *Argania spinosa* growing in the garden. This tree, belonging to the primarily tropical family the Sapotaceae, is endemic to southwestern Morocco, and is a relic from the time when this area had a tropical climate. Argan is probably the single most important plant of this region; at the heart of much of the local culture and economy, being used for culinary and health purposes, washing, feeding animals, fuel, and in much of the local traditional architecture. The area of Argan forest has decreased by around half over the last century due to agricultural intensification. It now covers about 828,000ha, and the Argan forest and surrounding area was declared a UNESCO Biosphere Reserve in 1998, as a means of promoting the protection and sustainable development of this area. Understandably, Argan would feature highly during our week, not just in our wildlife watching, but also in our meals and beauty regimes too!

Walking through the garden, we passed the filtration system for the 'grey water' from the hotel, which is used for irrigation of the many herbs, vegetables and fruit trees that would be putting an appearance in our meals over the coming days. A tangle of Sweet Potato *Ipomaea batatus* grew alongside the pools, and a couple of North African Water Frogs gazed at us blankly from the water. We spotted Speckled Wood and Greenish Black Tip butterflies, along with the first of an outrageous number of Painted Ladys we would see during the week, as Sardinian Warblers tutted and scolded in the scrub.

Setting off along the small neighbouring road, we spotted the first of the many spiny plants we would be finding; a useful adaptation in a heavily grazed landscape. These were the 'chicken-wire bush' *Launaea arborescens* with its small yellow flowers, and *Ziziphus lotus*, used as dead hedges around fields. Walking along a goat track through the Argan orchards, which were busy with chattering House Sparrows, we could also pick out the chaotic jumble of Serin song, with some fleeting views of this lovely streaked, yellow finch.

Along the track we found the leaves of Branched Asphodel Asphodelus ramosus with patches of fragrant, feathery-leaved Egyptian Lavender Lavandula multifida, the fine leaves of Cladanthus arabicus and the violet flowers of Fagonia cretica. Along the edges of the track we found both Nettle-leaved Figwort Scrophularia peregrina and Spring Garlic Allium subvillosum in flower, along with the large White-flowered Broom Retama monosperma, which was proving popular with the bees. As we were turning to retrace our steps, we spotted our first Moussier's Redstart; a male with the broad white head stripe and rich orangered underparts. This beautifully-marked bird is an endemic resident breeder found in dry and rocky areas

of northwest Africa (Morocco, eastwards to Tunisia). Then it was time for a delicious lunch of vegetable tajine on the terrace.

This afternoon, we took a walk to the local village Tighanimine El Baz (Valley of the Eagle), accompanied by local resident Ahmed. On the edge of the village we found a bank adorned with *Androcymbium gramineum*, a beautiful low-growing bulb in the Colchicum family. Here we also found the leaves of Sea Squill *Drimea maritima* and the endemic *Narcissus broussonetii*, with one or two still in flower, along with the unassuming *Dipcadi serotinum*. Passing along the south of the village we spotted the North African subspecies of Chaffinch feeding on the ground with Greenfinch and House Bunting, and Blue Rock Thrush and Southern Grey Shrike perched on houses and bushes. A Booted Eagle soared through the sky, as we headed for the now dry riverbed, full of Oleander *Nerium oleander*. After a short climb up a rocky track we reached a viewpoint over the village, with the fluty song of Black-crowned Tchagra drifting up from the valley below. Try as we might, we couldn't spot the skulking bush shrike but we did enjoy some good views of Crested Lark and Black Wheatear. Completing our loop of the village we spotted more butterflies for our day's list, which included False Mallow Skipper, Green-striped White and African Babul Blue, as we returned to the hotel for the evening.

After dinner we were treated to a traditional Berber tea ceremony, during which Hassan explained the significance of tea in Berber culture and hospitality, while he prepared mint and absinthe teas for us to try.

#### Day Three: 22nd December. Palais Salam. Taroudant. Tioute Palmery.

This morning we set out east to the town of Taroudant, passing through the important agricultural area of the Souss valley, with crops including oranges, bananas and salad crops spotted in fields and under polythene, ready for export to northern Europe.

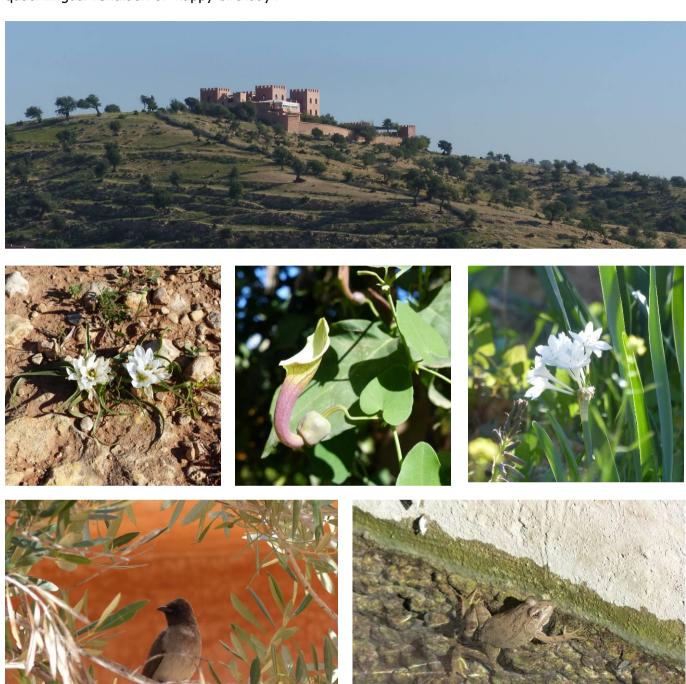

Taroudant is often described as a mini-Marrakech with its mud-plastered ramparts dating back to the 16<sup>th</sup> Century, an imposing and impressive sight on arrival. Our trip started with a visit to the peaceful Hotel Palais Salam tucked away from the hustle and bustle, inside the town walls. Once a Saadi palace on the major caravan route between the north and the Sahara, the hotel's courtyards embody elements of traditional Islamic gardens as places of rest and reflection alongside running water and, importantly, a reminder of the promised paradise.

Following a stop for mint tea and orange juice, we looked at some of the interior rooms filled with Berber tile mosaics and Arabic wall designs. We explored the series of courtyards with their mixture of exotic plants, succulents and native trees, including a massive Rubber Plant *Ficus elastica*, pink-flowered Pink Ball Tree *Dombeya cayeuxii*, and flowering banana *Musa* sp. and Loquat *Eriobotrya japonica* before emerging back to the busy streets of Taroudant.

We took a short walk to the city walls, spotting Cattle Egrets and waves of Little Swifts whipping through the skies, their white rumps visible as they zoomed by, before heading to the centre of town. Our first stop was a small argan cooperative, where the hand extraction of oil from roasted 'nuts' using a grinding mill was demonstrated, before we had a run through of the products for sale, and the various ails they could treat. Next, we headed to the Berber Souk, exploring stalls heaving with dried fruits, preserved lemons, bunches of herbs, mountains of spices, biscuits and more. Leaving Taroudant, we continued south-east towards the edge of the Anti-Atlas, and the village of Tioute.

We had lunch at the palmery here, home to an amazing structure of metal and cables supporting huge twisted wisterias, with a pair of White Storks picking around in the sidelines. After lunch we set off on a walk through the palmery; the Date Palms *Phoenix dactylifera* growing here require a constant source of water, and a network of irrigation channels cross the site to supply their demands. The dates produced by this palm are harvested from September and stored for later sale (in season at Christmas in the UK) or used as a source of food for local communities. Along the channels we found Maidenhair Fern *Adiantum capillus-veneris* and Brookweed *Samolus valerandi* growing, with several North African Water Frogs hanging in the flowing water, and occasional flybys from Epaulet Skimmer dragonflies. Walking among the trees and cultivated fields we found Andalusian Birthwort *Aristolochia baetica* and Wild Asparagus

Asparagus acutifolius, while Bath White and African Grass Blue butterflies were spotted in fields, across which we were occasionally brayed at by indignant donkeys. We spotted a Laughing Dove feeding on the ground with Chaffinch, and a pair of vocal falcons looked good for wintering Lesser Kestrel as they whizzed through in bright sunlight. Dinner this evening contained an extra course of birthday cake and a quadrilingual rendition of 'happy birthday'!

Top - Atlas Kasbah. Middle - *Androcymbium gramineum*; Andalusian Birthwort *Aristolochia baetica*; *Narcissus broussonetii*. Bottom - Common Bulbul; North African Water Frog.

#### Day Four: 23rd December. Souss Massa National Park. Oued Souss.

Following breakfast, we were met by Mohammed and a supporting cast of 4-wheel drive vehicles ready for our visit to Souss Massa National Park, south of Agadir. The National Park was established in 1991, and covers an area of almost 34,000 hectares of sand dunes, steppe, wetlands and argan forest. Souss Massa has particular significance for its colonies of Northern Bald Ibis, as well as being an important site for many other breeding and wintering birds. We were of course also here for the mammals! The 'Sahelo-Saharan megafauna' is one of the most endangered assemblages of large animals in the world, threatened by a combination of lack of grazing through competition with domestic livestock (primarily goats and camels), and over-hunting, with increasing numbers of high powered weapons now freely available across large swathes of their former range (such as Libya, Tunisia, Mali and Chad). Once widespread across the arid regions of North Africa, almost all the large mammals of the Sahara are now extremely rare in the wild four important members of this megafauna have been 're-wilded' here in the Souss Massa National Park.

We drove through two large enclosures that form part of the captive-breeding programme here. In the 2,000ha Rokein reserve we found the handsome Addax, a large and ghostly pale antelope with long twisted horns. Addax are native to arid stony and sandy areas out in the Sahara proper, where they graze on a range of vegetation. In the wild they are critically endangered, with some last individuals possibly clinging on in Mauritania, Chad and Niger; a survey in 2016 of key habitat identified just three wild Addax. Fortunately captive populations including these in Morocco, mean the Addax still persists as a species, but its future in the wild at present is far from secure. Sharing the enclosure, were the much smaller and shier Dorcas Gazelle, with their beautiful lyre-shaped horns and intricately marked faces. These antelope too have declined across their North African range; however they are still doing reasonably well in the wild. Joining the antelope was the Red-necked Ostrich; this North African subspecies is the largest of the ostriches, making it the largest bird in the world. It is noticeably more colourful than the sub-Saharan birds, and we encountered several heavily pink-flushed males beginning to display; clearly spring was on the way!

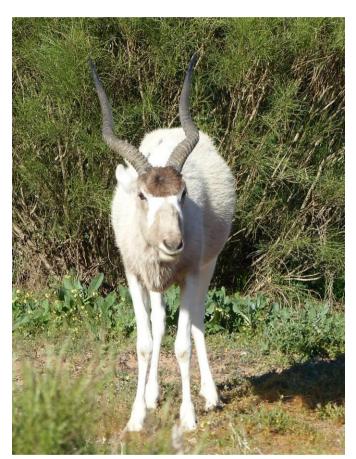

Entering the next enclosure we met the third of our antelopes, and the largest, the beautiful Scimitar-horned Oryx with their ginger neck, tear-shaped face marking and swept back scimitar horns, in the nearby 1,200ha reserve of Arrouais. Like the Addax, the Scimitar-horned Oryx has not fared well, and was declared extinct in the wild in 2000. The population here at Souss Massa is now the largest single herd left on the planet. Scimitar-horned Oryx once grazed extensively across North Africa, migrating seasonally with the rains. There are now ambitious plans from Chad to re-establish this species in the wild, at its former stronghold in Ouadi Rimé-Ouadi Achim Game Reserve. In late summer 2016, the first individuals were released into the wild, with a calf born in September 2016 considered the first 'wild born' Scimitar-horned Oryx for over 30 years. The project aims to have a self-sustaining population of 500 animals within five years.

Alongside the megafauna, we spotted several Spur-thighed Tortoises enthusiastically seeking out shade, along with plentiful Crested Larks dashing along the ground or perching on rocks and posts. Recent rains had encouraged many plants to flower, in particular Field Marigold *Calendula arvensis* and *Heliotropium crispum*, with abundant leaves of Giant Fennel *Ferula communis* and Branched Asphodel, flowering this time, along with a small patch of the unusual *Nonea calycina*.

As we approached the coast with views to the dunes and the Atlantic Ocean, a large flock of Northern Bald Ibis was spotted circling and coming in to land. We headed out of the enclosure to nearby Tifnit Beach where the flock had settled along the shoreline. After carefully relocating behind the group of some 80 birds to avoid the glare of the sun, we were able to get an appreciation of these 'ugly birds' with the greens and purples in their plumage showing magnificently. Along the shore a Little Egret waded in the shallows and a White-breasted Cormorant flew by, but all attention was, understandably, on the ibis. Once widespread across southern Europe, North Africa and parts of the Middle East, the Northern Bald Ibis is now critically endangered; its decline due to various factors including pesticide poisoning, hunting, disturbance at their nest sites, and more recently; loss of their foraging habitat to coastal development. They reached a low of only around 100 birds by the 1990s. The last remaining Middle Eastern birds were a tiny colony near Palmyra in Syria, who migrated down via the Yemen to Somalia and Eritrea for the winter.

These birds were doomed by the various conflict zones that make up their territory and are now almost certainly extinct. Thankfully, the Moroccan population has been a conservation success story with the population now over 600 individuals, split between two nesting areas; one to the north in Tamri, and here in the Souss Massa National Park.

Lunch was at a local coffee shop, which had the dual attraction of providing a wealth of ceramics, woodcraft, shoes, rugs and more, and we started our journey back north towards Agadir with some additional Moroccan wares! Our final stop of the day was the estuary at Oued Souss, spotting circling White Storks with a Black Stork in their midst as we drove. Approaching the water, a Peregrine was spotted perched on a log, contemplating its next move. Spread out through the water large groups of waders graded into one another; Greater Flamingo, Black-winged Stilt, Curlew and Ruff, with Common Sandpiper and Dunlin weaving around muddy edges. Moving a bit further along we found a large group of Avocets, joined by Grey Plover, along with an Osprey preening and bathing in the shallows, and a group of Glossy Ibis flying by, before it was time to head back to the Kasbah.

Top - Addax; Dorcas Gazelle; Scimitar-horned Oryx. Bottom - Northern Bald Ibis; Nonea calycina.

#### Day Five: 24th December. Atlantic coast. Oued Tamri. Cap Rhir. Agadir Oufella.

We set off north this morning, towards Agadir, and along the Atlantic coast. The vegetation quickly began to change, with low-growing coastal steppe vegetation mixed with areas of succulent *Euphorbia* scrub. We were headed for the mouth of the Oued Tamri to check out bird activity before we turned our sights on the interesting plant communities in this area.

Disembarking at a windy estuary as a Zitting Cisticola darted overhead, we found a beach full of gulls; Yellow-legged, Lesser Black-backed, and good numbers of the smaller and more delicate-looking Audouin's. Using the telescope we were able to read a ring on one of the Audouin's Gulls, which had been ringed as part of a research project in Doñana National Park in Spain.

Making our way along the sandy beach towards the lagoon, we spotted an Osprey sitting on the sandbar. Whether it was the presence of a bird of prey or the wind, the lagoon was very quiet, with just the odd snoozing Ruddy Shelduck, Grey Heron and Cormorant, along with a couple of dark-capped Moroccan Wagtails picking along the beach. We spotted a couple of new plants growing in the sand here including Sea Spurge *Euphorbia paralias* and the sprawling yellow Cretan Bird's-foot-trefoil *Lotus creticus*, before a large herd of Dromedaries was driven down to the water and past us along the beach.

Heading back south we stopped just beyond Cap Rhir to explore the *Euphorbia*-dominated communities we had passed earlier. This plant community here is unique to the south-west Morocco coastline, down into coastal Mauritania and across to the Canary Islands. They are a botanical link between this part of Morocco and the flora of the North Atlantic Islands, collectively termed the Macaronesian flora. In the geological past this flora would have been more widespread on the mainland; becoming confined to these climatically favourable areas during recent cycles of glaciation.

Vegetation here was dominated by a mixture of three succulent species - the umbrella-forming lime-green shrubby *Euphorbia regis-jubae* (found here and in the Canary Islands), the cactus-like *Euphorbia officinarum* (found in southern Morocco and down to Mauretania), and the succulent groundsel *Kleinia anteuphorbium* (endemic to Morocco). Among these succulents were a number of other interesting plants including the yellow-flowered *Astericus imbricatus* (another Moroccan endemic), the saltwort *Salsola oppositifolia*, the almost translucent flowers of *Paronychia argentea*, a small patch of the purple-flowered sea-lavender *Limonium mucronatum* and the sticky-leaved Yellow Restharrow *Ononis natrix*. We also found a couple of spikes of the parasitic *Cynomorium coccineum* emerging out of the sand. A couple of intrepid volunteers established that the rotting flesh smell it uses to attract pollinating flies was not yet fully mature, and it was currently akin to a mild stinkhorn fungus!

A tiny Moroccan Lizard-toed Gecko and several yellow *Buthus* sp. scorpions were found sheltering under rocks, and as we sat down to lunch, the wonderfully marked Busack's Fringe-toed Lizard was spotted scuttling through the vegetation. We were also treated to several small groups of Northern Bald Ibis flying over as we explored; much shorter and thicker necked, and without the projecting toes of their cousins the Glossy Ibis.

Making our way back, we had a final stop at the ruined Agadir Oufella, much of which was destroyed in the earthquake that struck the city in 1960. This promontory provided views over the fishing port, the city itself, and on to Souss Massa National Park, the High Atlas and Anti-Atlas. It was then time to retreat to the Atlas Kasbah ahead of a very special evening...

We were met at seven by Hassan and Fadna who gave us some bread fresh from the outdoor oven, along with a delicious cucumber and yoghurt drink, before we were led into a dining room transformed into a Berber salon. There was an opportunity to immerse ourselves in the culture of our hosts and learn about everything from health and beauty, to the beautiful Arabic script, all to a backdrop of traditional music provided by local musicians, as we enjoyed a festive evening with a Berber twist.

#### Day Six: 25th December. Anti-Atlas. Ait Baha. Laatik.

Heading south-east, this morning we took the road to Ait Baha, one of the larger towns in the western Anti-Atlas to explore the plants and landscapes of this region. The Anti-Atlas contains some of the oldest rocks in the world; an ancient mountain range that started to form 300 million years ago, and once rivalled the Himalayas in height. Today, they are much eroded, the highest peaks reaching between 2,500 and 2,700m. A major feature of the Anti-Atlas is the highly folded rock strata, numerous valleys and rounded peaks, with many villages still living their traditional lifestyles.

As we approached across the river valley of the Souss, we made our first stop to explore a field filled with Apple of Sodom *Calotropis procera*, a tall plant with greyish leaves. This highly poisonous plant is the larval foodplant of the Plain Tiger, a butterfly related to the well-known Monarch. The caterpillars are able to tolerate and sequester the plant's steroidal heart poison, and we managed to spot two of these resilient larvae as they chomped away.

We stopped in Ait Baha for a coffee or two, leaving with an impressive ratio of new shoes to travellers, following a visit to its cobblers' market, before continuing our climb into the High-Atlas. Soon, we were spotting Barbary Ground-squirrels scuttling among the rocks, along with Bibron's Agama basking in the burgeoning sun. We were headed for the village of Laatik to visit an ancient *agadir*; a fortified grain store dating from the time when the local Berber tribes still fought each other (this particular *agadir* is some 770 years old). These buildings are typical of the Anti-Atlas and other could be spotted during the day, in various states of repair, perched on high ground with commanding views.

We were shown inside by the local trusted custodian to see the structure of the *agadir* with its storage rooms accessed by stepping stones, some doors still bearing the black cross to fend off the advances of the beautiful but dangerous *Aisha Kandicha* of Moroccan folklore. A number of Spur-thighed Tortoises roamed around the *agadir*, daubed with red or green paint to highlight their presence; it is one of the beliefs here that tortoises will protect your homes from scorpions. House Buntings were also busy drinking, feeding and bathing around the small well. Outside the *agadir* we found the hairy purple-flowered *Echium horridum* and a number of large grain threshes. These are still in use; every April a team of six donkeys thresh the barley harvest, a proportion of which is always donated to those in need.

Starting our journey back there was time for a stop to explore an area of rocky hillside to soak up the landscape of Argan and the beautifully tight cushions of the *echinarum* form of *Euphorbia officinarum* (considered by some to be a distinct subspecies). The Branched Asphodel was joined here by the smaller and finer leaved Hollow-stemmed Asphodel *Asphodelus fistulosus*, along with more *Androcymbium gramineum*, French Lavender *Lavandula dentata* and White Mignonette *Reseda alba*. Continuing our journey home we spotted the endemic yellow-flowered *Hesperolaburnum platycarpum*, whose stems are used to make Berber baskets, before another chance for coffee (or *nous nous*) in Ait Baha.

Above - House Bunting; Plain Tiger; Branched Asphodel Asphodelus ramosus.

#### Day Seven: 26th December. High Atlas. Cascades du Imouzzer.

Driving north on the coast road, our route cut inland to explore the foothills of the western High Atlas. Our first stop was within a narrow river gorge at around 200m, the vegetation still very much dominated by Argan trees, with *Euphorbia officinarum* on the dry slopes, alongside Wild Olive *Olea oleaster* and the interesting African Wolfbane *Periploca angustifolia*. Again, we heard the song of the Black-crowned Tchagra drifting through the air, as it skulked among the vegetation, before we spotted a Small Copper basking on the rocks, and both Moussier's and Black Redstart hopping among the vegetation.

Moving a little further we stopped next to explore the open woodland of the Thuja *Tetraclinis articulata*. This conifer is primarily found in Morocco and Algeria, with two small relict populations in Malta and Andalucia. Morocco holds 600,000ha of the 1Mha world population of the tree. Well-known for its unusual grain and rich colour, tetraclinis wood is handcrafted to produce ornaments and kitchen utensils; its large burrs a result of 'self-coppicing', a way of coping with wildfires and overgrazing, are much prized by woodcarvers. The resin, sandarac gum, is used to make a liquor taken as a remedy for cramps, insomnia and difficult childbirths. The name refers to the cones, which are split into four, and its finely divided foliage. We also found the interesting purple-flowered *Globularia alypum* flowering here.

Carrying on our way, we reached the palmery at the start of Paradise Valley, spotting a Kingfisher perched on the rocks, its colours showing fantastically in the light, with a Grey Wagtail calling as it flew by. A little further still along the winding roads, through valleys full of blossoming Almond *Prunus dulcis*, and we spotted two raptors soaring on the thermals; Bonelli's Eagles, an adult with the clean white body streaked with black, and a younger buff-coloured bird. We continued on to our lunch stop below the Cascades du Immouzer, which were not cascading!

Turning for home we made a stop to check out a white-flower spotted on the hillside above us; a display of several *Narcissus cantabricus*. We also had the chance to enjoy the shrubby milkwort *Polygala balensae* here, in full flower with its rich purple and yellow flowers adorning the road verges, alongside the bright yellow broom *Genista tricuspidata*. We drove along a valley at about 1,300m where the south-facing side was dominated by the glaucous fans of the Dwarf Fan Palm *Chamaerops humilis var. cerasifera*, whilst on the cooler north facing side, different vegetation was present, including stunted looking Kermes Oaks *Quercus coccifera*. This is a species of the Mediterranean but can be found this far south only in the cooler and more amenable climate found at altitude in the High Atlas. We spotted several large and bright Cleopatra butterflies here, along with Thekla Lark, but despite plenty of promising-looking scrub could only track down Sardinian Warbler and Blackbird.

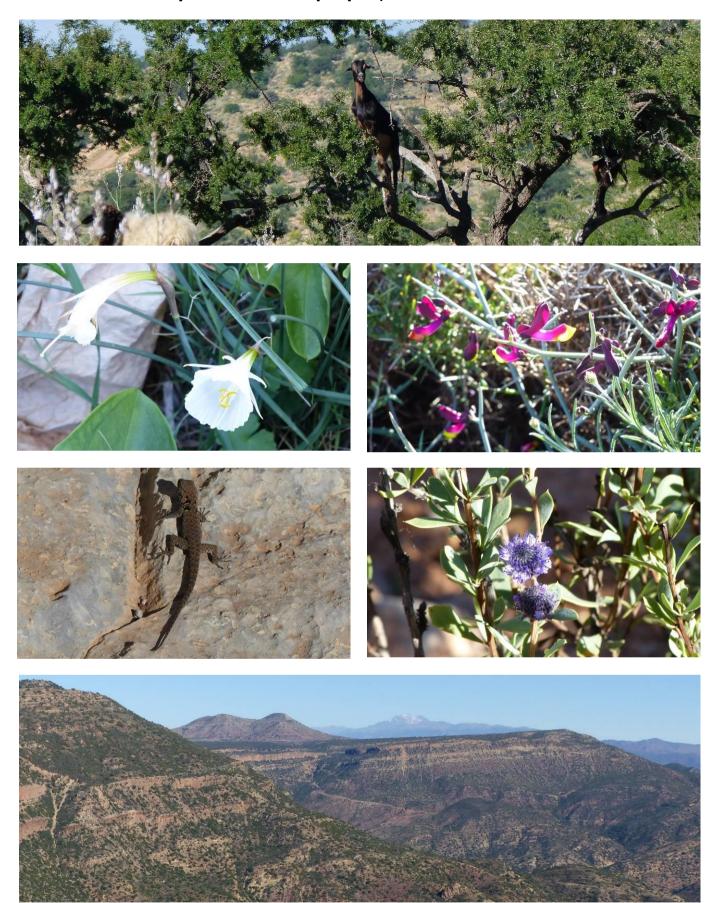

One final stop was at a viewpoint over the High Atlas at around 1,550m, where we found a steppe-like dwarf shrub vegetation growing on what was almost limestone pavement. Yet more *Polygala balensae* was present, along with *Narcissus cantabricus* at ground-level and the unassuming flowers of *Phagnalon saxatile*. We also spotted several Moroccan Day Geckos basking on the rocks here, before we made our way back out of the mountains. Following our final dinner, there was time to appreciate the stars from the roof terrace before retiring for the night.

#### Day Eight: 27th December. Return to the UK.

This morning there was time for a leisurely breakfast, and to enjoy the gardens of the Atlas Kasbah, before one final tea on the terrace, and an opportunity to thank Mohammed for his driving during the week, and Hassan and Hélène, along with M'Bark, Hussein, Rachida, Fadna and the rest of the staff for their warm welcome during our stay. Thankfully no drones were encountered during our return journey...

Thank you to all the travellers for joining us in Morocco - I hope it was the breath of fresh air you were seeking this festive season!
