## 15<sup>th</sup> June 2021. Purbeck Heaths

Our first morning saw us driving the short distance, via Corfe Castle and its gap in the chalk ridge, to that most 'Dorset' of habitats, the lowland heaths of the newly-created 'mega reserve' of Purbeck Heaths National Nature Reserve. We explored the Hartland Moor sector of what is now amongst the largest nature reserves in the country, formed by joining up three earlier National Nature Reserves, and protecting some of the very best lowland heathland habitat in the world...

With the recent sunny weather continuing through the day, it was a little too warm to stand much of a chance of finding any reptiles, for which the area is so famous, but the conditions were pretty near perfect to give us the opportunity to find some of the area's special invertebrates.

A trio of day-flying moths got us off to a good start, with the nationally scarce Small Grass Emerald, a Four-dotted Footman (not to be confused with the Four-spotted Footman of course...) and a well-marked Grass Wave, all specialities of the Dorset heaths. Silver-studded Blues were newly emerged, with several resting amongst the heather.

Heading to a peaty-edged pond, we found our first dragonflies of the morning: Azure Damselfly and Four-spotted Chasers were zipping across the open water, while the newly-emerged Keeled Skimmers were resting in the rushes. Around the damp edges, we also found the sticky leaves of sundews, with all three species present here: Oblong-leaved Sundew around the pond, Round-leaved Sundews on the damp tracks and a small group of Great Sundew by a smaller pool.

A larger pond was on a clay-ier part of the site, with muddy edges and less acidic water, more to the liking of Emperor Dragonfly, Broad-bodied Chaser and Black-tailed Skimmer, with Common Blue and Blue-tailed Damselflies around the reeds. Water Forget-me-not and Blue Water Speedwell were growing around the marshy margins, with the large white flowers of Lesser Water Plantain, a particularly scarce plant that has a liking for base-rich peaty water.

Phil led us to another damp reedy area, where Southern Marsh Orchid, Ragged Robin, Marsh Pennywort and Meadow Thistle were growing. The thistles seemed to be a favourite nectar source for the rare Brown-banded Carder Bee, while one of the real stars of the morning was the dainty Southern Damselfly, with several pairs flitting about amongst the rushes and posing enough for us to see the characteristic 'mercury' symbol on the 2<sup>nd</sup> abdominal segment through binoculars.

We then headed east across the site. Stonechat families were calling from the tops of gorse bushes, and a couple of jaunty Dartford Warblers hopped up, with their scratchy song and floppy-tailed song flight.

As we walked along the tramway, the remnants of Dorset's very first 'railway', a couple of Green Tiger Beetles flew up from the path in front of us. Phil was paying particular attention to the hot, bare sand along the track edge, where various bees and wasps were zipping about, the sand dotted with their nest holes. And before too long, his searching was rewarded with a lovely little dark-blotched, delta-winged fly, the Mottled Bee-fly. This is a 'cuckoo' nest parasite of the Hairy Sand Wasps which were particularly obvious along this section of the path, and yet another speciality of these southern heaths.

Around the corner, and yet another little buzzer put in an appearance, this time perhaps the rarest animal we would see all week: the Purbeck Mason Wasp, a very smart black, white and red species which is all-but endemic to the Purbeck Heaths, with one other population... in Iran, of all places! Along the raised bank of the tramway we saw at least five or six, including a particularly approachable mating pair, with the female wandering about feeding on Thyme flowers while the smaller male just held on and hoped for the best...

We reached the bus in time for lunch, before heading the short distance to the RSPB reserve at Arne for our desserts, with the first of several local ice creams sampled.

During the afternoon we walked a circuit across the heathland to look over the Middlebere Channel and out towards Poole Harbour and Brownsea Island. A flock of Little Egrets were gathered in one of the distant channels, with Shelduck and Oystercatchers on the mud. Unfortunately the local pair of Ospreys weren't in attendance today, probably deterred by the presence of a class of ecology students out across the marshes.

In the woods, several heaped nests of the scarce Southern Hairy Wood Ant were teeming with life, going about their business with just the occasional squirt of formic acid to deter the onlookers...

After dinner, we boarded the bus one more time, negotiating the narrow country lanes to head back out to the heaths as dusk fell. After a short wait we were rewarded with the 'gewick' calls, wing-clapping displays and churring song of several Nightjars. At least six different birds were around us, with one male putting on a particularly exciting display as he clapped his wings and angled his white tail spots to both deter an interloping young male and proclaim his territory to the female nearby.

### 16<sup>th</sup> June 2021. Portland

A longer journey this morning had us heading westwards, past the White Horse at Osmington and the resort town of Weymouth, then crossing the low-lying causeway of Chesil Beach to the 'island' of Portland.

Our first stop was in the seemingly insalubrious setting of an industrial estate, where we found the Dorset Wildlife Trust reserve Tout Quarry. Another sunny day brought out more butterflies, with our first Dingy Skippers, single Meadow Brown and Large Skipper, and a few Small Heaths and Common Blues.

Amongst the rocks and sculptures were plenty of interesting plants: Woolly Thistle, Slender Thistle and Carline Thistle, sturdy Perennial Wall Rocket and several spikes of Ivy Broomrape, a parasitic plant which here grows in a yellow form.

Walking over to the cliff, we had spectacular views out across Chesil Beach reaching back across to the 'mainland' and the saline lagoon of The Fleet behind it.

## Dorset 2021: trip report and species lists

Back on board, and we moved down to Portland Bill. At the very tip of the 'island' we had Rock Pipit flying around the rocks, with Razorbills and Guillemots just offshore. A few Gannets flew slowly past along with a pair of Kittiwakes at one of their very few nesting sites in Dorset. Then, out amongst the Guillemots feeding in the currents offshore, Phil picked out a single Puffin, a good bird to see before it drifted further out, turning into a tiny dark blob out amongst the waves...

Plants on the cliffs included Rock Samphire, Golden Samphire, Sea Beet and the uncommon Rock Sea Spurrey.

After a picnic lunch with sea views, we walked up onto the slopes above the Bill. Although it was warm, the sun kept hiding behind the clouds, and the butterflies here weren't quite what we had hoped, although we still found Small Blue, Meadow Brown, Small Heath and Large Skippers, while a fast-flying medium-sized orange fritillary flew past us and away... the one that got away. Day-flying moths included both Six-spot and Five-spot Burnet Moths, Cinnabar, Yellow Shell and a very well marked Mother Shipton, but the star was perhaps the stunning Cream-spot Tiger that posed for everyone's cameras.

The grassland had plenty to keep the botanically minded enthralled. Several lovely Bee Orchid spikes were looking particularly fresh, while the Pyramidal Orchid buds were just about bursting. Corky-fruited Water Dropwort, Crow Garlic, Slender Tare, Yellow Vetchling and Bastard Toadflax were amongst the scarcities, while perhaps the rarest of the plants were the two spikes of Early Gentian, an early-flowering, dwarf version of the more familiar Autumn Gentian.

Heading downslope, we visited the small quarry, where a Little Owl was scowling at us from the rocks, along with a couple of Stock Doves.

At the famous Portland Bird Observatory, we were welcomed into the garden by the long-time warden Martin Cade, who had saved the contents of last night's moth trap for us to enjoy, most notably several handsome Small Elephant Hawkmoths, as well as plenty of 'brown jobs' with amazing names such as Heart and Dart, Bright-line Brown-eye, Setaceous Hebrew Character, Shoulder-striped Wainscot and Light Brocade.

Time to head homewards, passing a Little Tern flying at the east end of the Fleet before the lure of a short bus-nap proved too much to resist...

### 17<sup>th</sup> June 2021. Jurassic Coast

Today it was the turn of the famous Jurassic Coast, heading south west to the famous (or should that be infamous, after the summer of 2020?) Durdle Door.

As we made our way down the sunny slope to take in the iconic Dorset scenery, we could hear both Yellowhammer and Corn Bunting singing from the fence higher up the hill.

Alongside the great views of the 'Door' itself, we were very pleased to find Lulworth Skippers on the wing. This small, olive-golden skipper can only be found on the hottest, sunniest, southward-facing slopes, and the conditions here fit the bill perfectly.

More Lulworth Skippers were found during our walk across to Lulworth Cove, along with a couple of lovely bright Adonis Blues, Small Blue, Brown Argus, Dingy Skipper, Large Skipper and an early Small Skipper. Phil found three more day flying moths: Citron Plume, Silver-barred Sable and Chalk Carpet.

After another sunny picnic at Lulworth Cove, we got back on board the bus, chalk-dusting the driver's freshly swept steps, and headed a little way east, through the resort town of Swanage, to Durlston Head NNR.

Much of our attention here was focussed out to sea, where Guillemots and Razorbills, Shag and Fulmar were all flying to and from their nest sites, hidden beneath us on the cliffs. A pair of Great Black-backed Gulls had three fluffy youngsters, looking very sweet: not at all the Guillemot-swallowing brutes that they would soon become. Rock Pipits flitted about the cliffs, a handful of Gannets passed by, with a pair of adult Mediterranean Gulls flying westwards and a Little Egret heading in the same direction a little further out.

Ploughman's Spikenard and Hound's-tongue were the more notable plants, amongst the Rock Samphire, Thrift, Thyme and Bird's-foot Trefoil that we were now familiar with.

After some of us visited the lighthouse, finding a jewel-like Rose Chafer along the way, we headed back towards the visitor centre... but not before we all had great views of a Peregrine cruising along the cliff beneath us.

One last sampling of the local ice cream flavours, and then it was back on board the bus. As if on cue, the rain arrived... bringing to a conclusion our enjoyable short break in Dorset.
